Introducing The **HercuLight** Series

- 68 kg
- 30-50% less maintenance
- Recyclable
- Reduces CO² emissions
- Your green choice

Light & Reliable

Driessen introduces the **HercuLight** durable and light cargo container line. Its new AKE container weighs 68 kg. The container is made of strong composite materials that meet Driessen's high quality standards to ensure a reliable and long-lasting product.

Save on Maintenance

With the new container, maintenance expenses can be reduced by 30-50% compared to aluminum containers. As the new containers are easy to maintain within less time, fewer containers will be out of service, which improves the operator's efficiency.

Environmentally-friendly

The container is made of recyclable materials, and thanks to our environment-friendly production methods CO² emissions are low. The production of composite materials consumes less energy than aluminum. Moreover, the lower weight of the containers will reduce the operator's CO² and NOX emissions. This makes Driessen's new **HercuLight** containers your environmentally friendly choice.
